

Packaging

Ultrapure components and systems are critical today for the success of hi-tech industries. Contamination can be introduced at each step in the production process and therefore packaging which is specific to the application is crucial to protect products which are vulnerable to externally introduced contaminants. In addition to control of contamination, the criteria for the selection of packaging are dependent on the area of application, suitability for sterilising and antistatic properties.

The basan range of ultrapure packaging consists of polyethylene and Tyvek® packaging including antistatic and sterilisable versions for the widest range of application. Our primary supplier is the Belgian company Newform (ATMI), who are specialists in the production of ultrapure, flexible packaging.

Please enquire for your regular basan contact partner about our wide range of packaging materials. We will be pleased to advise you, and if necessary visit you together with a colleague from Newform.
