

## Sterile face masks

With the publication of the new FDA Draft-Guideline „Sterile Drug Products Produced by Aseptic Processing“, there will be an ever increasing requirement for personnel protection in aseptic processing.

To support the implementation of these FDA requirements, basan is introducing the ‚Gamma Mask‘ from Berkshire.

The masks are irradiated with a minimum Gamma Irradiation dose of 25kGy and reduce particle contamination from the mouth and nose area. The 3-layer construction ensures both easy breathing and high filtration efficiency.

The wide (195mm) fitting further reduces particle contamination.

Each mask is individually packed to ensure sterility. Sterilisation information and batch numbers are printed on each pack.

Please contact basan for further product information, data sheets and samples.
